NURNABI ACADEMY · RECORDING SCRIPTS

# Paper 4 Revision Paper Intro & Outro Scripts

*Five videos — written to be read aloud, straight through*

Cambridge IGCSE Mathematics 0580 · Paper 4 · Calculator, Extended

5 videos · 5 intros · 5 outros · 100 marks · 2 hours

Intros 32–36 s | Outros 36–41 s | read at 155 words per minute

Each script is one continuous paragraph, written the way it should sound when spoken. Read it straight through without stopping; the full stops carry the pauses. All text is selectable: copy any block straight into TTSMaker to rehearse it.

This is the five-video plan. Video 3 has been rewritten to match the recorded lesson: questions 13 to 17, from the cubic turning points to the negative enlargement.

# 1 Number and Early Algebra

Video 1 of 5 · Q1–6 · 14 marks

**INTRO** 82 words · ~32 seconds @ 155 wpm

> Hello and assalamu alaikum. Welcome to my channel. Thank you for joining me today. This is video one of five in our Paper 4 revision paper, and today our topic is **Number and Early Algebra**. Paper 4 is the calculator paper: two hours and one hundred marks. Fourteen of those marks are decided in these first six questions. We will cover equations, percentages, ratio, sequences and factorising. The blank paper is in the description; download it, pause and attempt each question first.

**OUTRO** 104 words · ~40 seconds @ 155 wpm

> That completes the opening section: fourteen marks. May I leave you with one piece of advice. On a calculator paper, put the whole numerator and the whole denominator inside brackets before you press equals. Most marks lost in question two are typing errors, not mathematical ones. If any step was unclear, please leave a comment below. I read every comment, and I will reply to the best of my ability. And if this video helped you, please subscribe and turn on the notification bell, because video two continues straight on with interest and equations. Thank you for watching, and I will see you there.

# 2 Interest, Equations and Formulas

Video 2 of 5 · Q7–12 · 18 marks

**INTRO** 84 words · ~33 seconds @ 155 wpm

> Hello and assalamu alaikum. Welcome to my channel. It is good to have you with me again. Today our topic is **Interest, Equations and Formulas**, questions seven to twelve, eighteen marks. We will calculate compound interest, find a simple interest rate, solve simultaneous equations, simplify an algebraic fraction, change the subject of a formula and find the number of sides of a regular polygon. These are the questions that reward a clear line of working. Please pause and give each one a genuine attempt.

**OUTRO** 105 words · ~41 seconds @ 155 wpm

> That completes the second section: eighteen marks. Let me leave you with one piece of advice. Compound interest is one multiplier raised to a power, never six separate years written out. Nine hundred and fifty, multiplied by one point zero three four, to the power six. One line, and one rounding, at the very end. If one of these questions gave you trouble, tell me which one in the comments and I will reply to the best of my ability. Please subscribe, and tap the bell, so that video three reaches you the moment it is published: calculus, graphs and vectors. Thank you for watching.

# 3 Calculus, Graphs, Vectors and Transformations

Video 3 of 5 · Q13–17 · 24 marks

**INTRO** 94 words · ~36 seconds @ 155 wpm

> Hello and assalamu alaikum. Welcome to my channel. Thank you for continuing with the series. This is video three of five, and today our topic is **Calculus, Graphs, Vectors and Transformations**, questions thirteen to seventeen, twenty-four marks. We will find the two turning points of a cubic, read acceleration, distance and average speed from a speed–time graph, calculate exponential decay, write vectors in terms of a and b, and describe a rotation and draw a negative enlargement. These are the marks that separate an A from an A-star. Pause and attempt each question first.

**OUTRO** 100 words · ~39 seconds @ 155 wpm

> That completes twenty-four marks. Your task this evening is a simple one. Write down, from memory, what the gradient of a speed–time graph gives you, and what the area underneath it gives you. Acceleration, and distance. Students lose that mark every single session by exchanging the two. If you are still unsure, write your question in the comments and I will answer it to the best of my ability. Please subscribe and turn on notifications so that you do not miss video four: circle theorems, the cubic graph and trigonometry. Thank you for watching, and I will see you there.

# 4 Circle Theorems, Curves and Trigonometry

Video 4 of 5 · Q18–20 · 24 marks

**INTRO** 90 words · ~35 seconds @ 155 wpm

> Hello and assalamu alaikum. Welcome to my channel. Today our topic is **Circle Theorems, Curves and Trigonometry**, questions eighteen to twenty, twenty-four marks. We will find three angles in a circle and give a reason for each, complete a table and draw a cubic curve, estimate a gradient by drawing a tangent, and then use the cosine rule, the sine rule, a bearing and an angle of elevation. One word of caution before we begin: check that your calculator is set to degrees. Please pause and attempt each question first.

**OUTRO** 94 words · ~36 seconds @ 155 wpm

> That completes twenty-four marks, and the most demanding questions on the paper. Your task this evening is a simple one. Write out every circle theorem reason, word for word. Examiners mark the wording, not the idea alone, and the angle on its own earns you nothing. If you are unsure which reason applies to a particular question, ask me in the comments and I will reply to the best of my ability. Please subscribe before you go, and tap the bell, because video five completes the series: probability and statistics. Thank you for watching.

# 5 Probability and Statistics

Video 5 of 5 · Q21–22 · 20 marks

**INTRO** 90 words · ~35 seconds @ 155 wpm

> Hello and assalamu alaikum. Welcome to my channel. This is video five, the last of our Paper 4 revision paper, and today our topic is **Probability and Statistics**, questions twenty-one and twenty-two, twenty marks. We will complete a tree diagram without replacement, find the probability of at least one blue counter, calculate an estimate of the mean from grouped data, draw a histogram, draw a cumulative frequency curve and read the interquartile range from it. Twenty marks, and every one of them is winnable. Pause and attempt each question first.

**OUTRO** 106 words · ~41 seconds @ 155 wpm

> That completes the whole paper: one hundred marks across five videos. Remember one thing from today. On a histogram, area is frequency, not height. Plot the frequency as the height and the question scores nothing, however neat the drawing. Sit this paper again from a blank page this weekend, under two hours, with your calculator, and mark it with the worked solutions. If any question is still unclear, write to me in the comments and I will reply to the best of my ability. Please subscribe, and share this playlist with one classmate sitting the same paper. I wish you every success. Thank you for watching.

# How the five videos split the paper

| VIDEO | SECTION | QUESTIONS | MARKS | TARGET RUNTIME |
|---|---|---|---|---|
| 1 | Number and Early Algebra | Q1–6 | 14 | 15:30 |
| 2 | Interest, Equations and Formulas | Q7–12 | 18 | 19:30 |
| 3 | Calculus, Graphs, Vectors and Transformations | Q13–17 | 24 | 25:30 |
| 4 | Circle Theorems, Curves and Trigonometry | Q18–20 | 24 | 25:30 |
| 5 | Probability and Statistics | Q21–22 | 20 | 21:30 |
| | **Whole paper** | Q1–22 | **100** | **1:47:30** |

> Runtime = one minute per mark, plus ninety seconds for the intro, the outro and the transitions around them. The spoken intros and outros are 32–41 seconds each, so they sit comfortably inside that allowance. Videos three and four are the long ones: if either runs past twenty-eight minutes, split it at a question boundary rather than speeding up. Students do not leave because a video is long. They leave because it is rushed.

### How these scripts are built

- **Greeting and courtesy first.** Every intro opens with a greeting and a word of thanks, and every outro closes with one. Courtesy is not wasted time — it is what makes a teacher sound like a teacher rather than an advertisement.
- **The topic is named within the first fifteen seconds**, in bold in this document, so the viewer knows immediately whether this is the video they were searching for. The channel name is deliberately not spoken; it is already on screen, in the handle, and under every video.
- **The mark count is always spoken.** “Fourteen marks”, “twenty-four marks”, “one hundred marks”. The numbers are what make a revision video feel like preparation rather than a lesson.
- **One specific instruction per outro.** Not “keep revising”, but “write out every circle theorem reason, word for word”. Specific instructions get followed; general ones do not.

### What is different about Paper 4

- **Say “calculator paper” in video one and mean it.** Students arrive from the Paper 2 series with non-calculator habits. The opening intro states the format plainly: two hours, one hundred marks, calculator allowed.
- **The accuracy rule is worth repeating on camera**, even though it is not in these scripts: three significant figures, angles to one decimal place, and never round in the middle of a calculation. It costs more marks on this paper than any single topic.

# Delivery notes

### How to read it

- Read each paragraph straight through in one continuous flow. Let the full stops do the pausing — roughly half a second each — and do not stop anywhere else.
- Warm and unhurried on the greeting; lift the pace from the moment you name the topic. That change of gear is what "lively" actually is: variation, not volume.
- Give the numbers weight: *fourteen* marks, *twenty-four* marks, *one hundred* marks.
- Smile on "assalamu alaikum" and on "thank you for watching". It is audible.
- Slow down on the final sentence of every outro. Ending slowly is what makes it feel finished rather than cut off.

### On screen

- **Greeting:** face cam. Let them see you before they see mathematics.
- **From the topic onwards:** cut to the question paper.
- **Video 1 only:** hold the List of formulas page for a few seconds while you name the topics.
- **Outro:** return to face cam, end screen in the last five seconds.

### The asks, and where they belong

- **The subscribe request comes after the teaching, never before it.** By the outro the viewer has had fourteen to twenty-four marks explained to them, and the request is reasonable.
- **It is tied to a reason.** Not "please subscribe", but "please subscribe so that video three reaches you".
- **The comment invitation is specific.** "Tell me which question gave you trouble" produces far more comments than "let me know what you think".
- **The promise is honest.** "I will reply to the best of my ability" — not "I will reply to everyone", which becomes impossible the moment a video succeeds.
- **The like button and the share request** stay off the script. Say the like line once, in the middle of the video, in one sentence. The share request is in the final outro only.

### Put these in the description, not the script

- **Chapter timestamps**, the blank-paper link, the worked-solutions link and the full playlist link. Spoken links are never typed out by viewers.
- **A pinned comment on every video** holding the blank-paper link, the two or three mistakes you expect most students to make, and a plain statement that this is a practice paper, not a predicted paper.

> **Description boilerplate — goes in every video**
